

Enhanced Solana Meme Sniper Blueprint

SOLANA MEME SNIPER BOT — ENHANCED EXECUTION BLUEPRINT

FINAL RATING TARGET:

95–97/100 realistic competitive architecture

NOTE:

This document is intended for educational and experimental trading infrastructure development.

API keys and secrets should be stored in environment variables (.env) and never hardcoded.

1. CORE INFRASTRUCTURE

PRIMARY WEBSOCKET:

wss://mainnet.helius-rpc.com/?api-key=YOUR_HELIUS_KEY

PRIMARY RPC:

https://mainnet.helius-rpc.com/?api-key=YOUR_HELIUS_KEY

BACKUP RPC:

https://solana-mainnet.g.alchemy.com/v2/YOUR_ALCHEMY_KEY

OPTIONAL FAILOVER:

https://beta.helius-rpc.com/?api-key=YOUR_HELIUS_KEY

USE:

- Helius websocket for realtime detection
 - Helius RPC for main transaction flow
 - Alchemy as fallback and redundancy
-

2. REQUIRED PACKAGES

npm install @solana/web3.js

npm install ws

npm install axios

npm install bs58

npm install dotenv

npm install pino

3. PUMP.FUN MONITORING

PROGRAM ID:

6EF8rrecthR5Dkzon8Nwu78hRvfCKubJ14M5uBEwF6P

USE:

- logsSubscribe()
- accountSubscribe()

DO NOT poll DexScreener for launches.

4. CORE EXECUTION PIPELINE

1. Detect launch through websocket

2. Extract mint + bonding curve

3. Run all filters in parallel

4. Calculate:

- liquidity
- reserves
- market cap
- buy velocity

5. Run anti-rug checks

6. Build Jupiter transaction

7. Send through Jito

8. Monitor exits

9. Auto sell

5. PRE-FILTERS

REJECT IMMEDIATELY IF:

- Liquidity < 8 SOL
 - Curve progress > 75%
 - Dev wallet > 15%
 - Mint authority NOT revoked
 - Top holders > 30%
 - Excessive sniper saturation
 - Suspicious wallet cluster detected
-

6. MOMENTUM INTELLIGENCE (NEW)

MANDATORY ADDITIONS:

CHECK:

- Buys per 10 seconds
- Unique wallet growth
- Buy acceleration speed
- Volume acceleration
- Wallet diversity

REJECT IF:

- only bots buying
 - velocity collapses instantly
 - suspicious wash activity appears
-

7. SNIPER SATURATION DETECTION (NEW)

AI SHOULD TRACK:

- number of buys in first 5–15 seconds
- average buy size
- bundle saturation
- early whale concentration

REJECT:

- overcrowded launches
 - excessive early bot concentration
-

8. WALLET REPUTATION ENGINE (NEW)

TRACK:

- serial rug wallets
- known scam deployers
- insider clusters
- repeated launch patterns

SCORING:

- Safe
 - Suspicious
 - High Risk
-

9. DECISION ENGINE

ALL CHECKS MUST RUN IN PARALLEL.

Return ONLY:

- BUY
- SKIP

NO HOLD STATE.

If conditions pass:

BUY immediately.

10. EXECUTION ENGINE

MANDATORY:

- prebuild transactions
- low-latency websocket
- Jito priority fees
- transaction caching

- parallel RPC fallback

IMPORTANT:

Simulation should be conditional during extreme launch congestion.

11. MULTI-RPC RACING (NEW)

AI SHOULD:

- broadcast through multiple RPCs simultaneously
- monitor slot lag
- failover automatically

PRIMARY:

- Helius

BACKUP:

- Alchemy
-

12. DYNAMIC PRIORITY FEES (NEW)

AI SHOULD:

- increase fees during congestion
 - adjust dynamically based on slot pressure
 - escalate during high competition launches
-

13. DYNAMIC SLIPPAGE (NEW)

DO NOT use fixed slippage.

AI SHOULD:

- increase slippage for extreme volatility
 - reduce slippage for stable liquidity
-

14. POSITION MANAGEMENT

Risk per trade:

1–1.5%

Max trades/day:

10

Max daily losses:

2

AFTER 2 LOSSES:

STOP TRADING.

15. EXIT STRATEGY

Take profits:

- 35% at 2.5x
- 30% at 8x
- trail remaining position

AUTO EXIT CONDITIONS:

- liquidity removal
 - whale dump
 - volume collapse
 - no movement for 15 minutes
 - rug indicators
-

16. WEBSOCKET RESILIENCE

AI MUST:

- reconnect automatically
 - maintain heartbeat pings
 - detect stale slots
 - detect websocket freezes
 - deduplicate events
 - cache signatures
-

17. DEXSCREENER USAGE

USE ONLY FOR:

- metadata
- socials
- liquidity display
- chart information

DO NOT USE FOR:

- launch detection
 - entry timing
-

18. JITO CONFIGURATION

USE:

Searcher

DO NOT USE:

Validator

PURPOSE:

- bundle sending
 - priority execution
 - transaction competition
-

19. YELLOWSTONE GEYSER

OPTIONAL ADVANCED UPGRADE.

USE ONLY WHEN:

- websocket bottlenecks appear
 - scaling aggressively
 - severe congestion competition
-

20. FINAL RULES

- speed over perfection
- websocket is mandatory
- exits matter more than entries
- filtering matters more than prediction
- avoid emotional/manual overrides
- low latency architecture is critical
